Description

This is a restaurant franchise website that will help customers peruse through the menu as well as order online.

The website is equipped with a restaurant locator so users can find a location near them

Features

- A shopping Cart
- A Mapbox API

Planning - Database

I used a one-to-many relational database to store menu items with their respective ID, description, and price.

Since I had pre load the data on the database, I used a class called Seed data that loaded the items in the database just once.

Technology Stack

- C#
- ASP. NET Core Framework
- Some Javascript
- SQL Database
- Bootstrap

Demo

What I Learned

- Learned how to use API. (Still learning)
- Learning Javascript
